

Payroll Validation System

The finance team in PSS group who takes care of processing payroll system now heavily spends time on validating enormous applicable rules on deductions/computing amount against various salary components. The existing environment has different sub systems, workflows and different teams to validate various computations.

The team is looking for an automated system which can take input/report from existing system and validate against pre-defined rule engine.

Further, system should be upgraded to configure rules such that rules are up to date.

Project scope:

- Define UI to upload the salary details of each qualified employees
- Define UI to upload rules which used to validate salary details.
- Create configurable window to update existing rules
- Create a window where specific actor would validate set of rules and forward to next team/actor
- The system should generate success/error messages and notify respective actors on validations.

The platform must be secure, scalable and available 24x7.
