

WeHealU

The story of **WeHealU** began a few years back, when Rahul decided to visit his Grandparents in a remote village. His grandfather suffered from a heart problem and had to travel 15 kms to visit his Doctor. The Doctor diagnosed that his grandfather required a bypass surgery as his heart condition was getting worse. Rahul was not keen on going ahead with the surgery without getting a second opinion, however he was not sure whom to consult.

He checked with friends, relatives, looked for online information from different forums, but ended up with varied responses and opinions. This experience made him come up with the idea of **WeHealU**, a platform to virtually connect doctors with individuals who were looking for medical advice.

Rahul is looking for an IT partner to help build a collaborative web based platform which will be the one-stop destination for patients to connect to the medical fraternity. It will allow patients and care takers identify the specialists, connect to them virtually and share diagnostic reports either through email messages or chat and seek advice. Based on the initial conversation, the patients or their care takers would book appointment with the specialist for detailed evaluation as well. Patients could share feedback and recommend specialists to family and friends through social media. This platform will provide options for secure storage and tracking of every user's history, medical record and reports digitally for future reference.

While **WehealU** opens the world of medical consultants/specialists to the patients and caretakers, it also provides visibility to medical specialists. They could list themselves on this platform and ensure they can serve patients from far away locations. Specialists will indicate the consultation charges per consultation, which would be handled seamlessly through online payment option on **WeHealU**.

As a future expansion plan, Rahul also wants pharmacies, hospitals, diagnostics, home care, and other service providers in the health ecosystem to get associated with this platform and offer their services. However he wants to launch the first version of this solution in the next 12 weeks, so that patients like his grandfather in need of consultation.

Note to customer to align features to capabilities:

Our aim is allow every campus mind to pick 1 user story and implement end to end to get an exposure to all layers UI, Business layer, service layer and DB.

Please ensure the following are addressed in the features they implement:

- Ensure CRUD (Create-Retrieve-Update-Delete) operations are covered as a basic minimum.
- Admin and end user operations to be considered throughout.
- Login
- Search
- Personalization
- Time box 1 could be more on MVP and Time box 2 on personalization.
