UNIVERSITY APPLICATION PORTAL

Problem Statement

- Develop a University Application Portal which has one type of role – student.
- The student can register himself on the portal with basic information (Name, username, password). Once the student logs in, he can see three tabs – My applications and List of colleges.
- In the list of colleges, the student sees all the colleges which are available to apply along with an APPLY button corresponding to each record. When the student clicks on apply, a form is displayed asking for details like Name, Educational Qualification, Course to be applied for, Date of Birth, City, State. On submitting that form, the application to that college is successful and the button "Apply" turns into a label "Applied".
- The My Applications tab shows the list of applications the student has made (details like Name of college, date of application submission).
